

Sum of the Prime Factors

In this section, we will make some determinations by separating the index of Qur'ān into prime factors. What do prime factors of a number mean?

Non-prime numbers can be separated into multipliers by using the appropriate prime numbers among the preceding. Let us explain it with a few examples:

Example:

Let us consider the number 6

Prime factors of this number: $6 = 2 * 3$

Let us consider the number 8

Prime factors of this number: $8 = 2 * 2 * 2$

Let us consider the number 75

Prime factors of this number: $75 = 3 * 5 * 5$

Let us consider the number 100

Prime factors of this number: $100 = 2 * 2 * 5 * 5$

In separation of factors, if exponential notation is used for the repeated multipliers,

$$8 = 2^3$$

$$75 = 3 * 5^2$$

$$100 = 2^2 * 5^2$$

Then the acquired notation is called as separating such number into prime factors, and the transaction is called the separation into prime factors (the **integer prime-factorization**).

$$a_0(100) = 2 + 2 + 5 + 5 \\ a_0(100) = \mathbf{14}$$

The largest number in the index of Holy Qur'ān is 286. In the following list, prime factors of the numbers 1 thru 286 and their sums are given:

In the figure, (prime-prime) distribution of the surahs with even a_0 (sequence number) and the surahs with even a_0 (number of ayats) is shown.

 **Question:** How many of the numbers in the sum of the prime factors of the number of ayats of the surahs are prime numbers and how many of them are not?

In order to give an answer to this question, we should have to constitute these two sets:

- * The set of surahs with prime a_0
[number of ayats]
- * The set of surahs with non-prime a_0
[number of ayats]

The set of surahs with prime a_0 (number of ayats)

Figure-22 The distribution of the surahs with prime and non-prime number in a_0 (number of ayats) is seen.

Evaluation

As you can remember, the number of ayats of the 114 surahs consists of 60 even and 54 odd numbers. Now, the same sharing occurs as prime and non-prime numbers in the sum of the prime factors of the number of ayats!!!

Let's see the results which outcome collectively:

We see above that the number of surahs with a prime number of a_0 (the number of ayats) is equal to the number of surahs with an even number of ayats. Now we observe that these two surah sets with equal number of members, take place in both the first and the second half of Holy Qur'an in equal numbers!

Let's see the results which outcome collectively:

In the figure, equal distribution of the surahs with odd number of ayats and the surahs with non-prime a₀(number of ayats) to the first and second half of the Qur'an is shown.

Question: when we consider the sum of the prime factors of the sequence numbers of the surahs, and the sum of the prime factors of the number of ayats, how many of them are homogeneous and how many of them are non-homogeneous with respect to being a prime number?

In order to give an answer to this question, we should have to constitute these two sets:

- * The set of homogeneous surahs with respect to a_0 (sequence number) and a_0 (number of ayats) being as prime numbers
- * The set of non-homogeneous surahs with respect to a_0 (sequence number) and a_0 (number of ayats) being as prime numbers

The set of homogeneous surahs with respect to a_0 (sequence number) and a_0 (number of ayats) being as prime numbers
